### Dental treatment for dementia: Can dentist treat brain sicknesses?

As average life expectancy has developed, dementia has become a major social issue, especially in developed countries. There is a close relationship between dental and general health. Oral conditions may also significantly affect the brain condition. The author has researched the efficacy of dental treatment as a method to improve overall health. Although severe dementia is seemed to be intractable, this study suggests that symptoms may be improved via dentistry. Underlining mechanism has not been clarified, so further research is required. The author believes this improvement is caused by stimulus of dental treatment to the brain via trigeminal nerve, which is the biggest in the cranial nerves. The author tried also many diseases i.e. Parkinson's disease, which might be caused by brain malfunction. Since I have had significant effectiveness in some cases, I would like to present the results of such cases.

### Biography

Yoshiro Fujii has completed his PhD from Aich Gakuin University and been running Shin Kobe Dental Clinic as a Manager. He has published more than 13 papers in international academic journals and has been serving as Editorial Board Member of three international academic journals, special session Speaker and Organizing Committee Member of 5th International Conference and Exhibition on Metabolomics.
