Medical Case Reports

June 30-July 02, 2016 Valencia, Spain

Medication trojans and surgical mismanagement

Mohammad Bukhetan Alharbi

Imam Mohammad ibn Saud Islamic University, KSA

Adverse events in surgical practice are not uncommon; many measures are applied to prevent such events. The worst case scenario, when patient medications are contributing to wrong surgical decision. The gray zone of many surgical clinical scenarios like, sepsis, hemorrhagic shock, cardiogenic shock during surgical catastrophe, etc are frequent events that are faced frequently in surgical practice, which may be initiated or manipulated by medication adverse events; medications have its own effects on the body. Sometimes the medications themselves are causing worsening condition instead of improvement. Others are causing new clinical complains which does not relate to the presenting complaint and make more challenges to the treating team, some studies explained that there are misdiagnosis in acute events, but they never address the medication history and its impact in the condition, assuming its faultless area. More studies should be addressed to consider medication; trojans and their effects in our unexplained clinical scenario, especially in case of morbidity and mortality.
