Treating of resistant cases of alopecia universalis

Shadi Khawadeh*Arabic Board in Dermatology, Plastic Surgeon, Jordan*

It is well known that prostaglandin-F is a hair follicle stimulant, and it is used as an anti-glaucoma drug and one of its side effects is to have longer eye lashes. From here came the idea to mix those kinds of eye drops with P.R.P treatment. So we received this 18 years lady with a history of 8 years of alopecia universalis and she tried all types of treatment without any response. Now after mixing P.R.P with eye drops for 6 sessions we got this amazing result that we can prove with pictures and for the safety of the drug with no systemic side effect except some abdominal cramps. And we start to use this treatment as well with androgenic alopecia and we received a great result superior to P.R.P alone.

Biography:

Shadi Khawadeh is a Dermatologist, skin surgeon and laser specialist, Plastic surgeon Assistant at Medicines sans frontiers in Jordan. He has done American Diploma in Aesthetic medicine
