Abstract

The purpose of this study was to examine the effect of demographic characteristics on financial satisfaction of individual investors in Pakistan. Base on a sample of 118 individual investors, Chi square test was conducted to investigate that which demographic characteristics are associated with financial satisfaction. Study revealed investors age and family size has significant effect on financial satisfaction. While investor gender, marital status, qualification, occupation, and income level has no influence on financial satisfaction. Present study is significant for the policy makers to understand the individual's financial satisfaction levels according to their gender, age, academic qualification, income level, marital status, occupation, financial knowledge, and family size.

Keywords: Demographic characteristics; Financial satisfaction; Individuals investors of Pakistan

Introduction

Individuals overall life satisfaction relates to series of life aspects. According to aspects includes "emphasizing the positive things in life, working in an area that one enjoys, taking care of one's finances, having relationships with happy people, overcoming negative events and learning from them, and being involved in pleasurable activities that enhance one's positive view of life and offer greater satisfaction". Among these attributes, individual's overall life satisfaction is mainly connected with their financial satisfaction.

"Positive financial behaviors contribute to financial satisfaction and financial satisfaction in turn contributes to life satisfaction".

Several studies divulge that individual's financial satisfaction is an important factor for overall life satisfaction [1,2]. Increasing healthcare expenses, children educational cost, and family needs required an individual to plan for long term to meet future financial satisfaction and protection [3].

According to the ministry of Finance (Pakistan, 2016-2017) "Public Expenditure on Education as percentage to GDP is estimated at 2.3 percentage in FY 2016 as compared to 2.2 percentage of GDP in FY2015. Along this the disease pattern is heavily dominated by malnutrition and poor dietary practices". These results shown that in Pakistan educational and healthcare expenses are increasing. These increasing expenses triggered the dissatisfaction of individuals with financial position. People who are dissatisfied with their conditions are more likely to have low self-esteem, anxiety, fear, and frustration.

Study conducted in Pakistan disclosed that some behavior biases of individuals have impact on their financial satisfaction. This study exposed behavioral biases like overconfidence and categorization tendency has significant positive impact on investor's financial

satisfaction levels. Others behavioral biases like Reliance on experts, Self-control bias, budgeting tendency, adaptive tendency has no significant impact on investor's levels of financial satisfaction [4]. Present study attempts to understand the money aspect of life satisfaction for the Pakistani individuals by finding the answer of the question that "Do demographic characteristics have an effect on financial satisfaction"? This increasing financial satisfaction level can cause intention for investment in individuals.

Present study is important for the policy makers to understand the individual's financial satisfaction level according to their gender, age, academic qualification, income level, marital status, occupation, financial knowledge, and family size. According to Sahi, [5] "policy makers would benefit from such empirical work as the study identifies changes that need to be made on a national level that would enable increase in financial satisfaction levels of the people".

Literature Review

Gender and financial satisfaction

Generally, it is perceived that men are more financially satisfied than women. This perception is supported by various studies and explored the similar results. These results are also supported by Bonke [6] and found a positive Relationship is exists between men and financial satisfaction, and female investors have less financial satisfaction [7].

Most of studies shown that investors gender has no significant influence on their financial satisfaction, Investors they are either male or female have the same level of financial satisfaction [5,8].

Based on the above literature investors gender is expected to have effect on financial satisfaction.

Hypothesis (1): Investors gender has significant effect on financial satisfaction.

Age and financial satisfaction

Age is also considered as a factor affecting the individual's satisfaction with financial matters. According to the study conducted by Sahi [5] in India "age has a positive and significant association with financial satisfaction". This result supports the various previous studies [7,9-12]. Another previous study also supports these results and disclosed that "older people, despite their lower levels of income, are more satisfied financially than younger people. High satisfaction among the elderly also appears to occur even at very low levels of income" [13]. Silda [3] in his study disclosed that among all demographic factors, age was the factor which shown significant impact on financial satisfaction. Similar study conducted in America disclosed that older Americans are very satisfied with their financial position [14]. Statistics regarding Norway also shown Norwegians older individuals are more financially satisfied [15]. Along these results some studies shown investor age has no significant impact on financial satisfaction [8].

Based on the above literature investors age is expected to have effect on financial satisfaction.

Hypothesis (2): Investors Age has significant effect on financial satisfaction.

Income and financial satisfaction

Most of prior studies intensively focused on the relationship between income and financial satisfaction [14,16]. These studies shown individuals income level has significant effect on subjective well-being [10,17,18]. Another study also disclosed similar results and concluded that "income was the ultimate source of financial satisfaction and higher income levels contributed to higher satisfaction with financial status. Money is an significant resource which is important for the individual to meet various social and material needs and hence is directly related to individual's financial satisfaction" [19]. Sahi, [5] in her study in India also supports these results and concluded that along other demographic factors like occupation, age, marital status individual's income level has significant impact on their financial satisfaction. These results were also disclosed by Joo and Grable [8] that investor age has significant impact on financial satisfaction.

Based on the above literature Income was expected to have significant impact the financial satisfaction of individuals.

Hypothesis (3): Increasing income level caused an increase in financial satisfaction.

Marital status and financial satisfaction

Sahi [5] in her study revealed that "Married people are more financially satisfied than single respondents". Numerous previous studies also disclosed that significant positive relationship is exist between marriage and financial satisfaction [20,21]. Joo and Grable [8] in their study disclosed that along other demographic factors like gender, age, and ethnicity marital status also has no significant impact on financial satisfaction.

Based on the above literature investors marital status is expected to have effect on financial satisfaction.

Hypothesis (4): Investors marital status has significant effect on financial satisfaction.

Academic qualification and financial satisfaction

Generally, it is perceived that academic qualification caused a financial satisfaction in individuals. Study disclosed "it is very possible that those with higher education earn more and hence are more likely to be financially satisfied. Further this study disclosed that it is also possible that a person with high education being dissatisfied with his financial position simply due to the fact that he is relatively less well off financially, rather than being actually deprived in any material way" [22]. Another study also shown similar results and concluded that academic qualification of individuals has significant impact on financial satisfaction [20]. Another study divulged that education has no direct effect on financial satisfaction, however, academic education has indirect effect on financial satisfaction [8].

Along these results some studies find academic qualification has no significant impact on individual level of financial satisfaction [5].

Based on the above literature academic qualification was expected to have significant impact on the financial satisfaction of individuals.

Hypothesis (5): Academic qualification caused an increase in financial satisfaction.

Occupation and financial knowledge

Investors occupational status is also considered as a factor which influence the investors level of financial satisfaction. However, very little studies have been conducted on this topic. Study conducted by Vera-Toscano et al. [19] explored that "people who are unemployed and retired, are having low levels of financial satisfaction, while for the students and the housewives, no significant relationship with financial satisfaction has been observed".

Sahi [5] in her study disclosed that "the people who are employed with government and semi-government organizations are found to have higher levels of financial satisfaction than other occupational profiles. This is because of a sense of security that is attached to the government jobs as compared to jobs in the private sector".

Based on the above literature occupational status was expected to have significant impact on the financial satisfaction of individuals.

Hypothesis (6): Occupational status has significant effect on financial satisfaction.

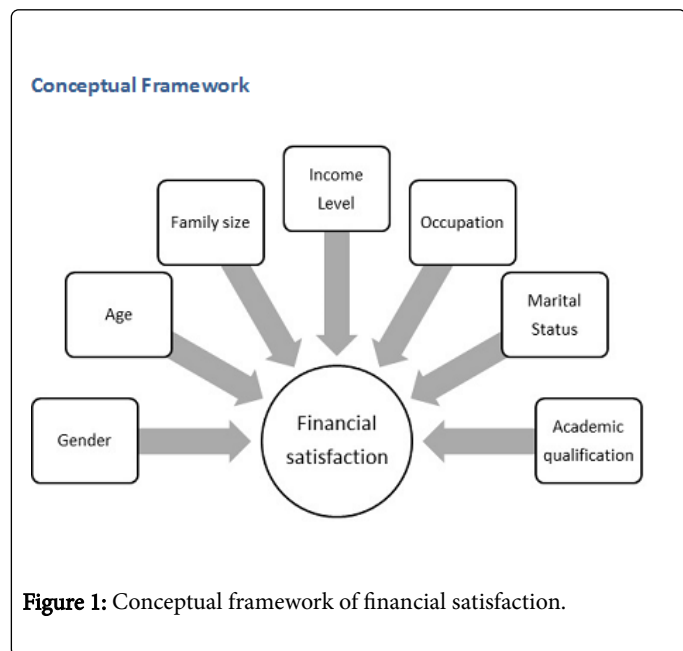

Family size and financial satisfaction

Numerous studies revealed that individual's family size have a significant impact on financial satisfaction. In his study disclosed that "joint family provides to the individual emotional, social and economic support and hence men who live in joint families have more satisfaction with their income levels, than those living in nuclear families".

Beside these results numerous studies shown no significant relationship is exist between family size and financial satisfaction. Joo and Grable [8] in their study disclosed that "no direct relationship between number of dependents in the household, but their study found a negative indirect effect of the number of dependents on financial satisfaction also support these results.

Based on the above literature family size was expected to have significant effect on the Financial satisfaction of individuals.

Hypothesis (7): Family size has significant effect on financial satisfaction (Figure 1).

Methodology

Population and sample

The population for the present study consists of investors having some financial knowledge or investment experience in Long term saving products such as insurance, saving accounts etc. Present study attempts to cover all types of individuals with different professional background. Age group, income level, gender, marital status, academic qualification, financial knowledge, and family size. Conveyance sampling method was used to interact the individuals Present study has interacted about 150 investors. Out of which 120 returns the questionnaires. After scrutinizing of questionnaires, we found 118 questionnaires which were completed and used by the study.

		Financial satisfaction			Total
		Low	Average	High	
Gender	Male	3	73	17	93
	Female	0	21	4	25
Total		3	94	21	118

^a3 cells (50.0%) have expected count less than 5. The minimum expected count is .64.

Table 2: Chi-Square test.

Variable, instrument and measures

Financial satisfaction: Financial satisfaction or financial well-being was rated on a 10-point self-assessment scale developed by Prawitz et al. [23]. According to the Prawitz et al. [23] this 8-item IFDFW Scale included “four items that represented a sense of one’s present state of financial wellbeing and four items that characterized one’s reaction to his or her present state of financial well-being” [24].

In order to sort the individuals according to their Financial Satisfaction, Study divide the it into three groups. Individuals having aggregate score between 1.0-4.0 represents “high financial distress/low financial well-being”. Individuals having score between 4.1-6.9 represents “average financial distress/average financial well-being” scored between 7-10 represents “low financial distress/high financial well-being”.

Demographic factors: Present study used seven demographic characteristics of individuals. These characteristics included individuals Gender, Profession, Marital status, Age, Family size, Academic-qualification, Income level, and financial knowledge.

Each characteristic is divided into subgroup to sort the individuals such as gender is sub-categories into male and female, Occupation is divided into service, profession, students, and business. Marital status is divided into single, married, widow, and divorced. Age is divided into below 30 years, 30-40 years, 40-50 years, 50-60 years, 60 years or above. Family size is divided into 2 members, 3-5 members, 6-8 members, 9 or more members. Qualification is divided into non-graduate, graduate, post graduate, professional education, or others. Income level is divided into Below Rs. 200,000, Rs. 200,000 -400,000, Rs. 400,000–600,000, Rs. 600,000-800,000, Rs. 800,000 or above.

Data analysis

Present study used the chi-square test to find the difference between individual’s financial satisfaction level according to their demographic characteristics. Statistical package SPSS was used to conduct this test (Tables 1 and 2).

Calculated value of chi-square is .939, where table value at 0.05 significance level and 2 degree of freedom is 5.991, where calculated value is less than the critical value, null hypothesis is accepted and

concluded that there is no relationship between gender and financial satisfaction (Tables 3 and 4).

		Financial Satisfaction			Total
		Low	Average	High	
Age	Less than 30	3	62	19	84
	30-40	0	20	0	20
	40-50	0	12	0	12
	50-60	0	0	2	2
Total		3	94	21	118

Table 3: Degree of relationship between age and financial satisfaction.

	Value	df	Asymp. Sig. (2-sided)

family size caused an increase in financial satisfaction, which shown increasing population does not influence the financial satisfaction at individual level. While investor gender, marital status, qualification, occupation, and income level do not influence financial satisfaction. Present study is important for the policy makers to understand the individual's financial satisfaction levels according to their gender, age, academic qualification, income level, marital status, occupation, financial knowledge, and family size.

Conclusion

The purpose of this study was to analyse the effect of demographic characteristics on financial satisfaction of individual investors in Pakistan. Study shown investors age and family size has significant effect on financial satisfaction. These finding revealed that increasing

Limitations

Present study is only designed to understand the effect of demographic characteristic on individual's financial satisfaction level. Data for the present study was collected from Rawalpindi and Islamabad. Further research needs to be directed with more data and across various demographic profiles, from several cities, to increase the generalisability of the findings in the Pakistani context. Further study should be conducted to understand why people in Pakistan feel more financial satisfaction with an increase in family size. Beside this further study should also be directed to understand why financial satisfaction goes on diminished in Pakistan with an increase in Age.
